

Basin Bag

Catch Basin Filter

DATA SHEET

The basin Bag™ is the solution for catch basin protection. It is reliable, economical, and easy to maintain. It is made from geotextile fabric; monofilament polypropylene. This fabric allows storm water to pass through while retaining silt and sediment within the bag interior. The filter bag is sturdy with welded seams. Simple in design, it requires no additional parts. To install the BASIN BAG™ lift the grate and insert into the mouth of the filter bag. Pull the lip of the filter over the rim of the grate and tighten with the pull cord. The grate and bag are now ready to install as one unit into the catch basin. The filter poses little danger to traffic. The grate holds the bag in place and serves as a ridged support for pulling the filter. The BASIN BAG™ requires regular inspection according to best management practices.
